Chapter 1 Systemic Factors and Prerequisites for the Inclusive Growth of the Russian Economy

George B. Kleiner, Maxim A. Rybachuk, and Venera A. Karpinskaya

Abstract The chapter provides the conditions for the transition of the Russian economy and society to inclusive systemic growth. The essential systemic components of the socio-economic space of Russia are determined. The transformation of these components is necessary for the transition to systemic inclusive growth. Two points of view on the socio-economic space of Russia are considered, which are of particular importance for the change to inclusive growth. The first is a system-wide point of view wherein the Russian economy is represented in the form of four systemic sectors interacting with each other in a chain: "the object sector—the environment sector—the process sector—the project sector." The second point of view represents society in the form of four relatively independent macro-entities. The interaction between these entities is also carried out along the chain: "state—society—economy—business." Taken together, the study of the two above-mentioned structures makes it possible to determine the directions of the systemic transformation of society, ensuring movement toward inclusive growth.

1.1 Introduction

The concept of inclusive growth as a target function of socio-economic development entered public discourse in the early 2010s. Usually, inclusive growth is understood as "long-term sustainable growth in productivity and employment, opportunities for a wide range of firms and households" [1]. The concept of inclusive growth is often reduced to the even distribution of income among different population segments [2].
